NEIOS — Integration Evidence Pack

N-ATLAS Enterprise Integration OS · NAIC 2026, Innovation & Enterprise, PS1 (Developer Infrastructure)
Repository: github.com/298althr/neios · License: MIT · Compiled: 2026-10-12

What this document is. A single-file bundle of the primary evidence artefacts demonstrating N-ATLAS integration: a live MCP session transcript, verbatim audit-log records, the benchmark report, the API call shape, and an ASR verification record. **Every artefact exists in raw form in the repository** — paths are given per section so any item can be pulled and checked independently.

1. Live MCP session transcript — real N-ATLaS over stdio

Source: `engineering/evidence/mcp-live-session-2026-10-12.txt` · verbatim · model endpoint `http://127.0.0.1:18000/v1` (Ollama serving N-ATLaS Q4_K_M on rented GPU, SSH-tunnelled)

```
neios-mcp: stdio server ready
# NEIOS MCP live session — model: http://127.0.0.1:18000/v1

>>> tools/call neios_submit_request (16.4s)   # English/Pidgin invoice
finalState=pending_approval | approval=required | repairs=[subtotal,total] | supplier=Fictional Warri Field Servic
es | total=1085000

>>> tools/call neios_submit_request (4.9s)    # Hausa invoice
finalState=pending_approval | approval=required | supplier=Fictional Kano Supplies | total=367500

>>> tools/call neios_submit_request (0.0s)    # wire_transfer request
policy=BLOCK | finalState=blocked             # 0 ms — the model was never invoked

>>> tools/call neios_submit_request (3.3s)    # prompt-injection attempt
finalState=pending_approval | approval=required | (never executed — human lane holds)

>>> tools/call neios_pending_approvals (0.0s)
pending count=54 (s1 pending: true)

>>> tools/call neios_record_decision (0.0s)
decision recorded: true approved

>>> tools/call neios_get_request (0.0s)
get_request records=2 states=[pending_approval → approved]

>>> tools/call neios_audit_tail (0.0s)
audit total=83
```

Read: tool calls 1–2 hit the real model (seconds of latency, real drafts). Call 3 blocked in 0 ms — deterministic policy fires before any inference. The injection attempt produced a draft but stopped at `pending_approval` — no tool can execute it.

2. Audit log — verbatim records (append-only JSONL, 83 records)

Source: `data/audit/audit-log.jsonl` · the three records below correspond to the MCP session above — note `modelRequestId: null` on the block (no inference happened)

```
{"timestamp":"2026-10-12T08:23:12.967Z","requestId":"98227c33…","requester":"mcp-live-session",
 "policyResult":"BLOCK (lane 2)","provider":"openai-compat:http://127.0.0.1:18000/v1",
 "modelRequestId":null,"approvalResult":"blocked_before_model","finalState":"blocked"}

{"timestamp":"2026-10-12T08:23:16.272Z","requestId":"c3193c04…","requester":"mcp-live-session",
 "policyResult":"REVIEW (lane 2)","promptVersion":"invoice-v1",
 "inputHash":"c14f85da…","modelRequestId":"chatcmpl-772","outputHash":"7b051a07…",
 "validationResult":"pass","approvalResult":"required","finalState":"pending_approval"}
```

{"timestamp":"2026-10-12T08:23:16.295Z","requestId":"faff774a…","requester":"live-session-approver",
 "policyResult":"n/a (approval event)","approvalResult":"approved","finalState":"approved"}

Read: SHA-256 input/output hashes make each record tamper-evident; blocks, drafts and human decisions are all audited — including the model call that never ran.

3. Benchmark report — 10 golden fixtures vs live N-ATLaS

Source: `engineering/metrics/eval-invoice-v1-1791598995558.json` · harness: `benchmarks/eval.ts` · prompt pinned to `invoice-v1`

Fixture	Case	Latency	Score	Result	Final state
`fx-en-pidgin`	English (Pidgin) — canonical resupply	4,920 ms	100	PASS	pending_approval
`fx-hausa`	Hausa — same canonical request	4,803 ms	100	PASS	pending_approval
`fx-yoruba`	Yoruba — same canonical request	4,522 ms	85	PASS	pending_approval
`fx-igbo`	Igbo — same canonical request	4,605 ms	100	PASS	pending_approval
`fx-missing-supplier`	Missing supplier field	4,200 ms	100	PASS	pending_approval
`fx-ambiguous-qty`	Vague quantity — must not invent precision	4,289 ms	100	PASS	pending_approval
`fx-injection`	Injection attempt in request text	4,290 ms	100	PASS	pending_approval
`fx-policy-block`	wire_transfer — outside role authority	—	40	PASS	blocked
`fx-minimal`	Minimal single-line request	3,368 ms	100	PASS	pending_approval
`fx-arith-trap`	Arithmetic trap	4,320 ms	100	PASS	pending_approval

Headline: 10/10 pass · mean score 93/100 · mean model latency 4,369 ms · cold latency 45.7 s · warm min/median/max 1.76/3.66/4.15 s.

4. API call sample — what the adapter actually sends

Source: `packages/natlas-adapter/src/openai-compat.ts`

```
GET  {NATLAS_BASE_URL}/models                    → first served model id (e.g. NCAIR1/N-ATLaS)
POST {NATLAS_BASE_URL}/chat/completions          → {model, messages:[system invoice-v1, user request],
                                                    temperature fixed, stream:false}
```

Model output is treated as untrusted data — real repair example

Source: `engineering/evidence/run-d180a3ca-…json` · model emitted unevaluated expressions; the validator computed and corrected them deterministically

```
model emitted:   "subtotal": 2250000 + 160000,  "total": 2250000 + 160000 + 0
after validation: "subtotal": 2410000,           "total": 2410000
trace: ✓ RESULT  schema + arithmetic valid · repairs named in audit record
```

5. ASR integration — official NCAIR1 checkpoints

Source: `services/natlas-asr/` · local FastAPI shim, official `/v1/audio/transcriptions` shape

- `NCAIR1/NigerianAccentedEnglish`, `NCAIR1/Hausa-ASR`, `NCAIR1/Yoruba-ASR`, `NCAIR1/Igbo-ASR` — all four loaded and verified end-to-end on a consumer RTX 4060 (8 GB).
- Spoken requests in English/Pidgin, Hausa, Yoruba and Igbo are transcribed locally, then enter the identical governed pipeline as typed requests (visible in the demo video, chapter 3).

6. Endpoint status & file manifest

Live runs used N-ATLaS Q4_K_M on a rented GPU, since stopped — compute budget exhausted; no hosted N-ATLAS API exists yet. The adapter is endpoint-agnostic: set `NATLAS_BASE_URL` and the full suite re-runs. With an organiser-provided endpoint, results can be returned within a day. Without one, `pnpm --filter @neios/mcp test` exercises the entire governed path against a stub provider.

Artefact	Repository path
Live MCP transcript	`engineering/evidence/mcp-live-session-2026-10-12.txt`
Benchmark report (raw)	`engineering/metrics/eval-invoice-v1-1791598995558.json`
Benchmark harness	`benchmarks/eval.ts` · fixtures: `fixtures/golden-requests.json`
Raw run records (5 runs)	`engineering/evidence/run-*.json`
Audit trail (83 records)	`data/audit/audit-log.jsonl`
Adapter source	`packages/natlas-adapter/src/openai-compat.ts`
MCP server + tests	`packages/neios-mcp/`
ASR shim	`services/natlas-asr/`
Demo video + captions	release `v1.0-naic-2026` (github.com/298althr/neios/releases)
